7. Brief Report : <p>Cancer is a disease that occurs when cells in the body grow abnormally and spread to other parts of the body. It can affect almost any organ or tissue in the body. Cancer is caused by changes to DNA. Most cancer-causing DNA changes occur in sections of DNA called genes. India's cancer landscape is shaped by multiple lifestyle-related risk factors. Harmful chemicals in the environment, such as asbestos and benzene causes the cancer. Tobacco consumption, whether through smoking or chewing, is the single most significant contributor to cancer in India. Local symptoms include lumps, coughing up blood, anemia, rectal bleeding, blood in the urine, or abnormal vaginal bleeding. Systemic symptoms include fatigue, unintentional weight loss, or skin changes. There's no single cure for cancer, but some cancers respond well to treatment.</p> <p>To promoting prevention, early detection, and efficient treatment to lower deaths, World Cancer Day serves as a significant worldwide platform for raising awareness of all forms of cancer. To raise awareness about the types, causes, treatment and prevention of Cancer, Dept. Of Zoology has organized 'World Cancer Day' Programme on 04-02-2025.</p> <p>Dr. B. Purushotham, Principal told about the BMI and the importance of nutritional food in the prevention of cancer. Dr. N. Chandra Mohan said about the stages of cancer and</p>
